

Why is Delta MS Better?

Delta MS is a HDPE membrane that keeps basements dry by providing an air gap between the soil and foundation wall.

- It goes on easy. No guessing on spray thickness or worrying about consistent coverage. (most asphalt based products need to be applied at 60 mills wet and dry to 40 mills to meet code requirements).
- Covers foundation cracks that form as a natural part of settling.
- Dimple Technology keeps wet soil away from the foundation. The air gap allows any moisture to condensate outward onto the membrane where gravity carries it down to the perimeter drain.
- Can be applied in any weather conditions. Rain, cold and heat won't affect the performance of Delta MS.
- Eliminates Capillary absorption through the concrete.
- The air gap created by the dimples eliminates head water pressure build up.
- Alkalinities in the soil can eat away the asphalt spray in just a few years allowing moisture to pass through and degrade the concrete.
- Delta MS is tough, clean and goes up quick; in 65' rolls that get nailed with a gun.
- No waiting for curing or multiple spray coatings. Can go up after right after forming and backfilled right away.
- Concrete can expel moisture during the curing process to the outside air gap rather than into the living space.
- Environmentally friendly - No VOC's – Won't dissipate into the soil and affect ground water.
- 5-year NO LEAK warranty and 10-year product warranty.
- Life expectancy to outlast structure.
